Lecture 2

Intro to Data processing: From bcl to count matrix

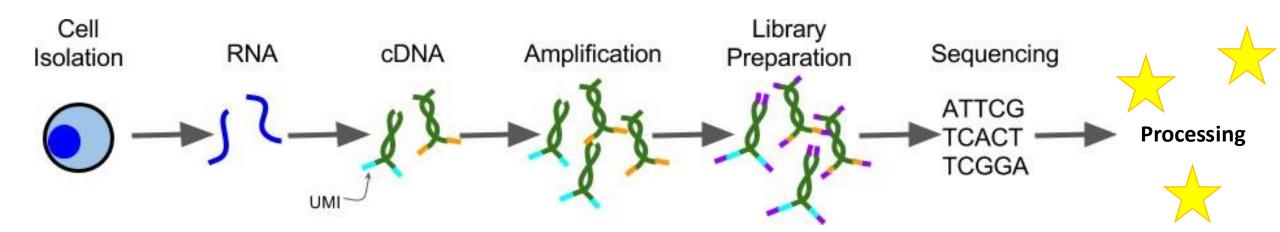

Physalia course 2024

Single-cell RNA-seq with R/Bioconductor

Instructors: Orr Ashenberg, Jacques Serizay, Fabrício Almeida-Silva

Experimental pipeline

Regardless of who is going to do the experimental steps, **DISCUSS WITH THEM !!!**

Experimental design is crucial for the success of a single-cell project !!!

Systematic comparison of single-cell and single-nucleus RNA-sequencing methods, Ding et al., Nat. Biotech. 2020

Get bcl file	bcl files – result of sequencing
Create fastq files	fastq files – R1, R2 and I files showing raw reads
QC: assess overall quality	
QC: remove low quality reads	
Align fastq to BAM	bam file – reads aligned to a reference genome
QC: collapse UMI	
View alignment	
Count matrix	count matrix – cell by gene, showing expression of gene in cell

Get bcl file

- Create fastq files
- QC: assess overall quality
- QC: remove low quality reads
- Align fastq to BAM
- QC: collapse UMI
- View alignment
- Count matrix

.bcl files

.bcl:

- Raw data output of a sequencing run
- Binary, non-human-readable file
- Contains the base calling and quality score per cluster per sequencing lane

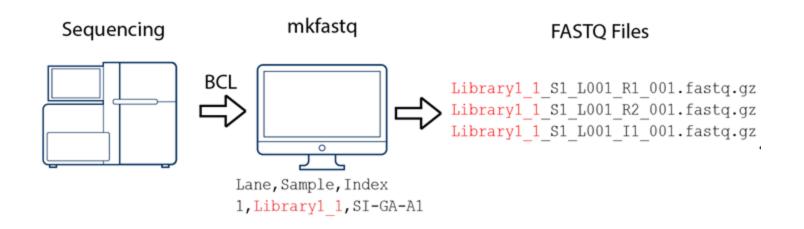

Get bcl file Create fastq files QC: assess overall quality QC: remove low quality reads Align fastq to BAM QC: collapse UMI View alignment Count matrix

That is the role of the sequencing machine!

Command:

bcl2fastq --run-folder-dir <bcl_files_folder> -p 12 --output-dir <fastq_files_folder>

User guide:

support/documents/documentation/software_documentation/bcl2fastq/bcl2fastq_letterbooklet_15038058brpmi.pdf

Command:

bcl2fastq --run-folder-dir <bcl_files_folder> -p 12 --output-dir <fastq_files_folder>

User guide:

https://support.illumina.com/content/dam/illumina-

support/documents/documentation/software_documentation/bcl2fastq/bcl2fastq_letterbooklet_15038058brpmi.pdf

How is a .fastq organized?

Each fastq file contains reads, each read is composed of 4 lines:

- 1. A sequence identifier with information about the sequencing run
- 2. The sequence (the base calls; A, C, T, G and N).
- 3. A separator, which is simply a plus (+) sign.

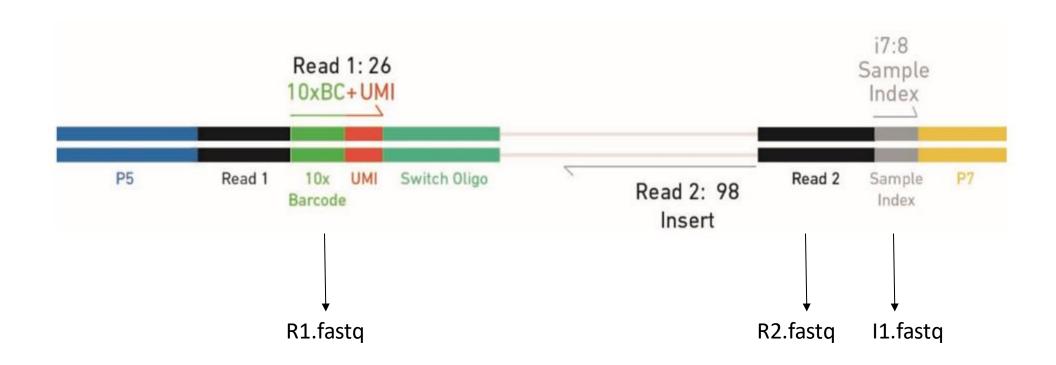

iacquesserizay@LOCAL[12:46:19]:~ \$ cat SRR11575369_1.fastq.qz | zcat |

4. The base call quality scores, using ASCII characters to represent the numerical quality scores.

Why do we end up with so many fastq files?

We sequence the paired ends of each DNA fragment molecule, in 3 different sequencing "runs".

I1 is important for demultiplexing multiple samples simultaneously sequenced

Each fastq generated by **bcl2fastq** contains a different information:

- I1.fastq contains sample index
- R1.fastq contains cell barcode + UMI
- R2.fatsq contains transcript information

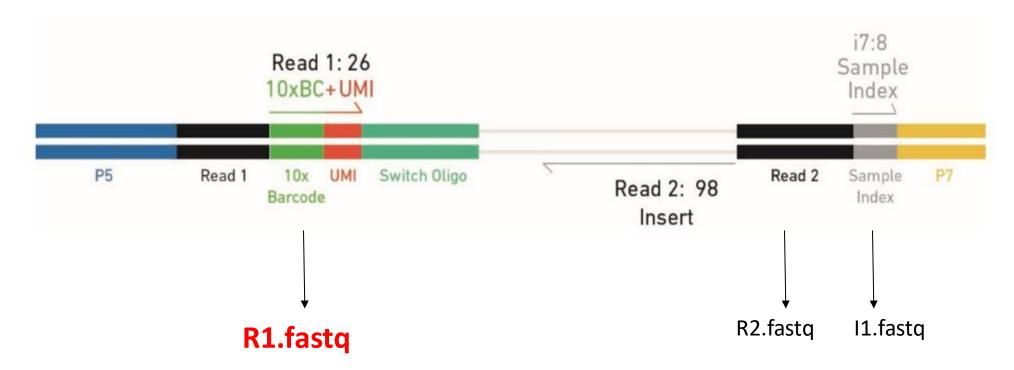

R1 contains information on the cell of origin (as well as a UMI)

Each fastq generated by **bcl2fastq** contains a different information:

- I1.fastq contains sample index
- R1.fastq contains cell barcode + UMI
- R2.fatsq contains transcript information

R2 contains sequence of the DNA fragment captured by sequencing

Each fastq generated by **bcl2fastq** contains a different information:

- I1.fastq contains sample index
- R1.fastq contains cell barcode + UMI
- R2.fatsq contains transcript information

Reconstructing actual molecules loaded in the sequencer

After demultiplexing, here is what you have:

R1.fastq		R2.fastq			
Cell	UMI	cDNA (50-bp sequenced)			
AAATTATGACGA	TGTGCTTG	GACTGCAC			
CGTTAGATGGCA	GGGCCGGG	CTCATAGT			
GACCTACGAGTT	AGTTTGTA	GCTCATAA

	Count matrix

That is the role of the sequencing machine!

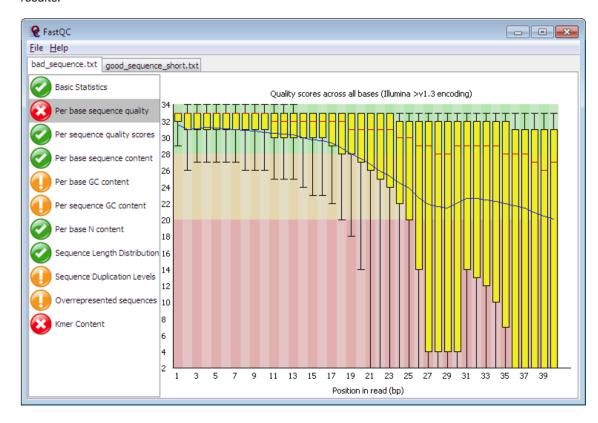

bcl2fastq

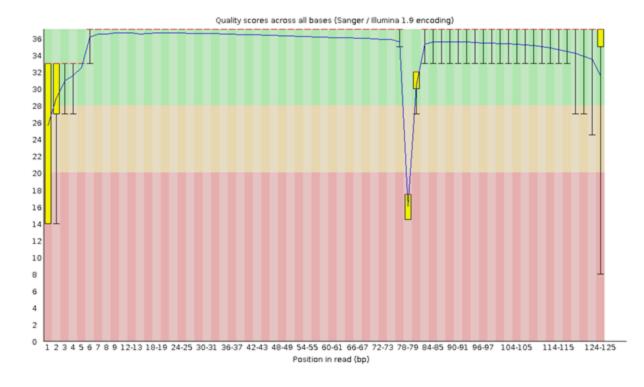

Raw sequencing QC is typically done with Fastqc

FastQC

FastQC is a program designed to spot potential problems in high throughput sequencing datasets. It runs a set of analyses on one or more raw sequence files in fastq or bam format and produces a report which summarises the results.

FastQC will highlight any areas where this library looks unusual and where you should take a closer look. The program is not tied to any specific type of sequencing technique and can be used to look at libraries coming from a large number of different experiment types (Genomic Sequencing, ChIP-Seq, RNA-Seq, BS-Seq etc etc).

	•	Get bcl file	That is the role of the sequencing machine!
	•	Create fastq files	bcl2fastq
	•	QC: assess overall quality	fastqc
		QC: remove low quality reads	
J.		Align fastq to BAM	
Cellranger		QC: collapse UMI

		Count matrix	

Filtering low quality reads

It is important to consider (and remove!):

- 1. Reads with overall low quality
- 2. Unrecognized cell barcode

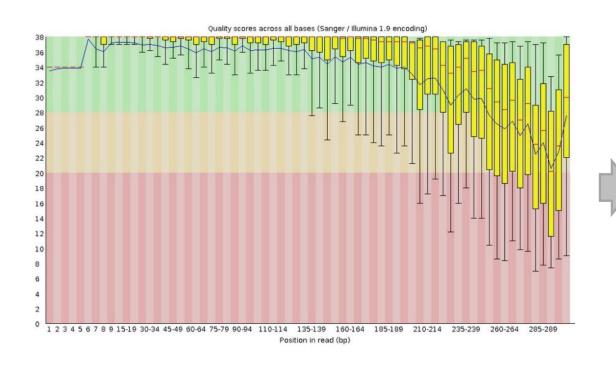

Filtering low quality reads

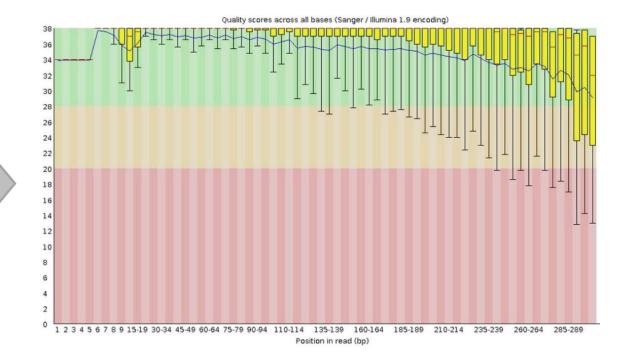

It is important to consider (and remove!):

1. Reads with overall low quality

2. Unrecognized cell barcode

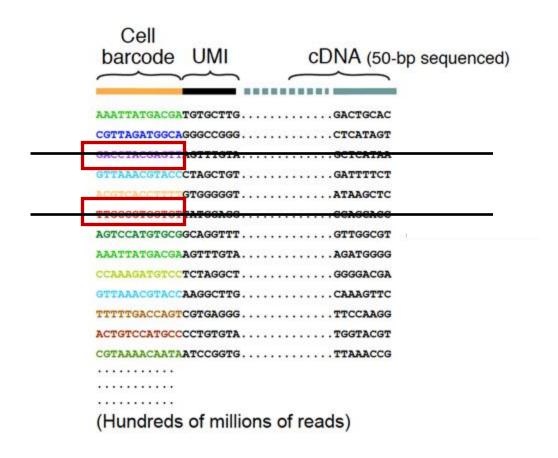

Filtering low quality reads

It is important to consider (and remove!):

- 1. Reads with overall low quality
- 2. Unrecognized cell barcode

What is a barcode whitelist?

List of all known barcode sequences that have been included in the assay kit and are available during library preparation.

For example, there are roughly 737,000 cell barcodes in the whitelist for Cell Ranger's Single Cell 3' applications. Here are the first 10 lines of the corresponding barcode whitelist 737K-august-2016.txt:

AAACCTGAGAAACCAT

AAACCTGAGAAACCGC

AAACCTGAGAAACCTA

AAACCTGAGAAACGAG

AAACCTGAGAAACGCC

AAACCTGAGAAAGTGG

AAACCTGAGAACAACT

AAACCTGAGAACAATC

AAACCTGAGAACTCGG

AAACCTGAGAACTGTA

Relaxing barcode filtering

How to correct barcode sequencing errors?

For every observed barcode in the dataset not on the whitelist, but 1-Hamming-distance away (i.e. 1 mismatch) from a whitelist barcode:

- Compute the posterior probability that the observed barcode originated from the whitelist barcode with a sequencing error at the differing base (based on the base Q score).
- Replace the observed barcode with the whitelist barcode with the highest posterior probability that exceeds 0.975.

		Get bcl file	That is the role of the sequencing machine!

Aligning reads to a transcriptome reference

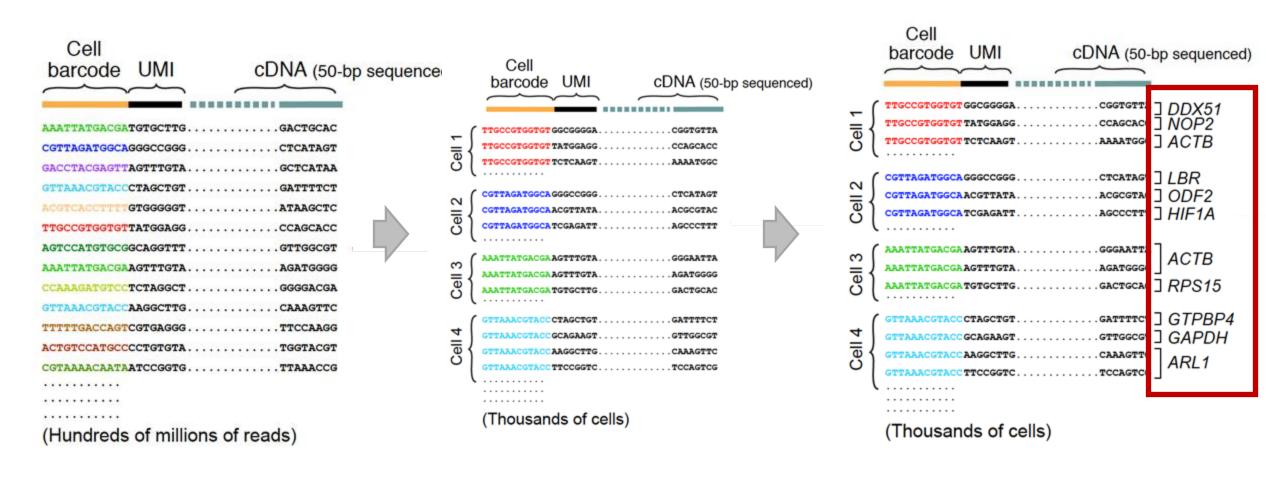

1. Group reads by cell-of-origin (using the cell barcodes)

Aligning reads to a transcriptome reference

- 1. Group reads by cell-of-origin (using the cell barcodes)
- 2. Recover which transcript the cDNA sequence aligns to

What do I need to align my reads?

Most aligners (included STAR-based cellranger) will map scRNAseq reads on a transcriptome index.

A transcriptome index consists of:

1. A **genome sequence** reference

FASTA example

>qi|568336023|qb|CM000663.2| Homo sapiens chromosome 1, GRCh38 reference primary assembly CCTAACCCTAACCCTAACCCTAACCCTAACCCTAACCCTAACCCTAACCCTAACCCTAACCCTA ACCCTAACCCTAACCCTAACCCTAACCCTAACCCTAACCCTAACCCTAACCCTAACCCTAACCCT TAACCCTAACCAACCCTAACCCTAACCCTAACCCTAACCCTAACCCTAACCCCTAACCCCTAACCCTAACCCTAACCCTAACCCTAACCCTAACCCTAACCCTAACCCTAACCCTAACCCCTAACCCCTAACCCCTAACCCCTAACCCTAACCCTAACCCCTAACCCTAACCCTAACCCCTAACCCTAACCCTAACCCCTAACCCTAACCCAACCCTAACCCCTAACCCCTAACCCCTAACCCCTAACCCCTAACCCCTAACCCCTAACCCCTAACCCCTAACCCCTAACCCCTAACCCCTAACCCCAACCCTAACCCCTAACCCCTAACCCCTAACCACACACCCTAACCCCTAACCCCAACCCTAACCCCTAACCCCAACCCTAACCCCAACCCCAACCCA CTAACCCTAACCCTAACCCTAACCCTAAACCCTAACCCTAACCCTAACCCTAACCCTAACCCTAACCCT CAACCCCAACCCCAACCCCAACCCCAACCCCTAACCCCTAACCCTAACCCTAACCCTAACCCTAACC CCTAACCCTAACCCTAACCCTAACCCTAACCCCTAACCCTAACCCTAACCCTAACCCTAACCCTAACCC TCTGACCTGAGGAGAACTGTGCTCCGCCTTCAGAGTACCACCGAAATCTGTGCAGAGGACAACGCAGCTC CGCCCTCGCGGTGCTCTCCGGGTCTGTGCTGAGGAGAACGCAACTCCGCCGTTGCAAAGGCGCGCCGCGC GCCGCGCCGCGCGCAGGCGCAGAGACACATGCTACCGCGTCCAGGGGTGGAGGCGTGGCGCAGGCGCAGAG AGGCGCACCGCGCGCGCAGGGCGCAGAGACACATGCTAGCGCGTCCAGGGGTGGAGGCGTGGCGCAGGC GCAGAGACGCAAGCCTACGGGCGGGGTTTGGGGGGGGCGTGTGTTGCAGGAGCAAAGTCGCACGGCGCCGG GCTTGCTCACGGTGCTGTGCCAGGGCGCCCCCTGCTGGCGACTAGGGCAACTGCAGGGCTCTCTTGCTTA GAGTGGTGGCCAGCGCCCCTGCTGGCGCCCGGGGCACTGCAGGGCCCTCTTGCTTACTGTATAGTGGTGG

What do I need to align my reads?

Most aligners (included STAR-based cellranger) will map scRNAseq reads on a transcriptome index.

A transcriptome index consists of:

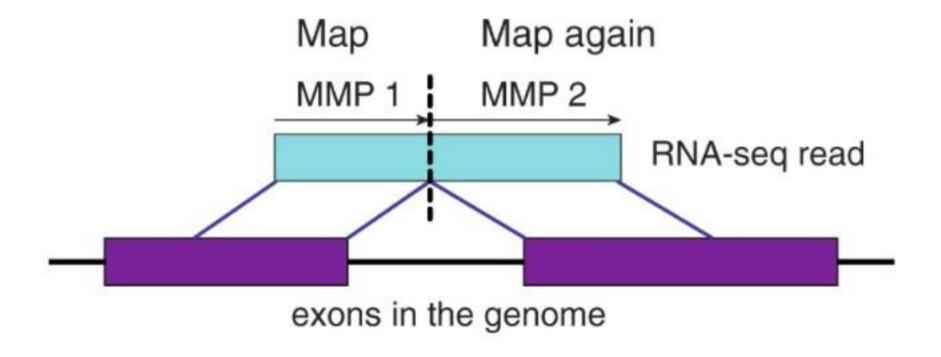

- 1. A **genome sequence** reference
- 2. A **gene feature annotation** reference

STAR is a traditional aligner that works by trying to find the longest possible sequence which matches one or more sequences in the reference genome.

STAR aligner

STAR is a traditional aligner that works by trying to find the longest possible sequence which matches one or more sequences in the reference genome.

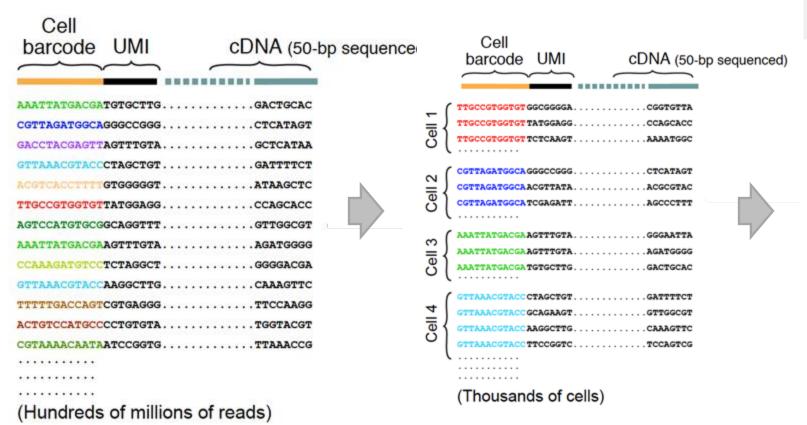

- Advantages: STAR is a splice aware aligner, making it suitable if you are interested in studying alternative splicing.
- Disadvantage: STAR requires a lot of RAM.

An alternative requiring less RAM is HISAT2.

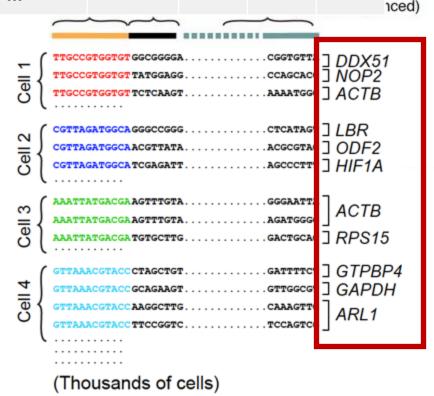

Aligning reads to a transcriptome reference

Physalia Courses

- Group reads by cell-of-origin (using the cell barcodes)
- 2. Recover which transcript the cDNA sequence aligns to

	Cell1	Cell2	Cell3	Cell4
ACTB	1	0	2	0
ARL1	0	0	0	2
•••

O		View alignment	
		Count matrix	

PCR duplicates

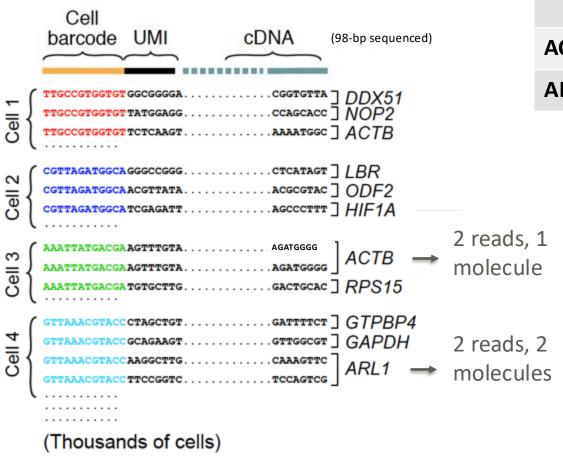

- PCR amplifications is an issue for both bulk and scRNAseq.
- During the PCR amplification process, some transcripts become over represented in the final library compared to their true abundance.
- The problem worsened when a high number of PCR cycles are used to generate the sequencing library, for example in scRNAseq due to the low amount of starting material.

Solution: using UMIs

UMIs enable sequencing reads to be assigned to <u>individual transcript molecules</u> and then the removal of amplification noise and biases from scRNAseq data.

	Cell1	Cell2	Cell3	Cell4
ACTB	1	0	1	0
ARL1	0	0	0	2

Columns: cells

Rows: features

Solution: using UMIs

"Error-correcting" almost-correct UMIs:

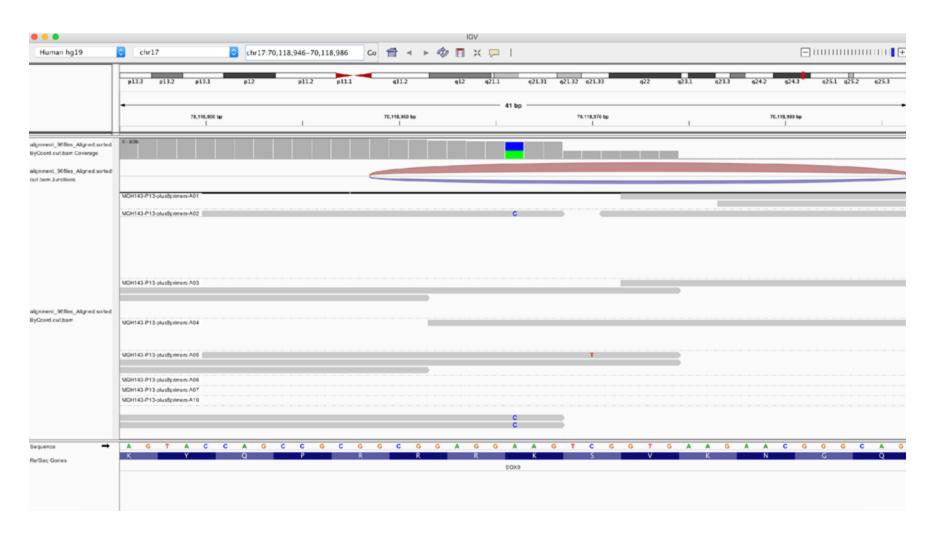

A UMI that is 1-Hamming-distance away from another UMI (with more reads) for the same cell barcode and gene is corrected to the UMI with more reads.

	•	Get bcl file	That is the role of the sequencing machine!
	•	Create fastq files	bcl2fastq

Cellranger count pipeline

Which reads are considered for UMI counting by Cell Ranger?

- 1. Only reads with a valid UMI and a valid 10x barcode.
- 2. No bases with base quality < 10.
- 3. Read maps to exactly one gene.
- 4. Overlaps an exon by at least 50% in a way consistent with annotated splice junctions and strand annotation.
- 5. Multiple reads that map to the same UMI will only count once.

Cellranger output

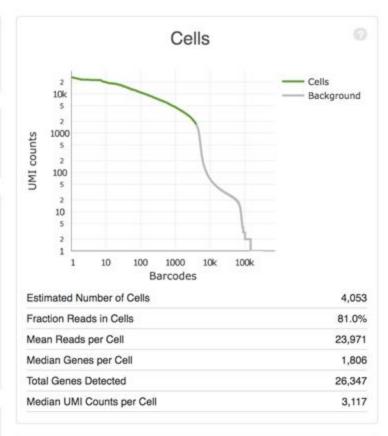

Estimated Number of Cells 4,053

Mean Reads per Cell Median Genes per Cell

23,971 1,806

Cell Ranger Version	2.2.0

Cellranger output

Some cell barcodes have many UMIs, but most do not.

Sequencing depth

How deeply do I need to sequence?

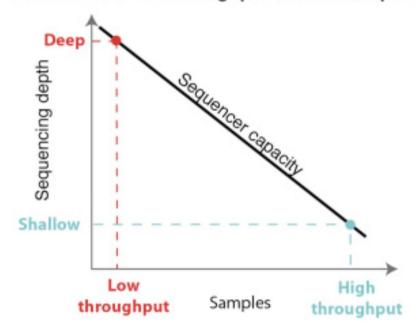

- At high sequencing depth, we can detect:
 - The expression of rare splice variants.
 - Quantitative modulations in transcript abundance.

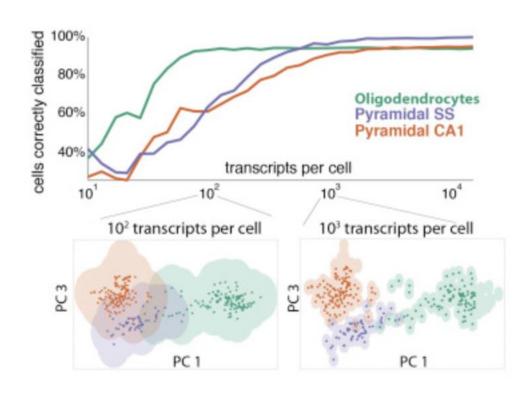

- Lower sequencing depth can still be very powerful:
 - Catalog of cell types.
 - Catalog of transcriptional programs.

How deeply do I need to sequence?

Tradeoff between throughput and read depth
